An easy-to-use software package with excellent graphical capabilities, Excel is an ideal way to teach and learn statistics at the introductory level. By organizing data into spreadsheets, Excel allows for easy analysis and graphic exploration. Its versatility, convenience, and reliability make it an attractive alternative to specialized statistical software. This manual was written specifically for using Excel with David Moore and George McCabe's Introduction to the Practice of Statistics, Fifth Edition (IPS) - a text that advocates using statistical software to free students from computations, allowing them to focus on the more practical matters of data gathering and analysis. No prior knowledge of the software is necessary. The manual provides a detailed introduction to Excel in the context of IPS and follows the text chapter by chapter to show how to use Excel to work through specific examples and exercises. In addition, the author developed add-in macros to assist in creating boxplots and normal quantile plots, a capability that does not exist in standard Excel. The macros are available on the textbook companion Web sit and can be downloaded and used on your own computer. This manual is compatible with Excel 2000 (Windows) and Excel 2001 (Macintosh), and the code successfully operates under all subsequent versions of the software, It is also easily adaptable for students using eXcel 97 (Windows) or Excel 98 (Macintosh). - Back cover.

Introduction to Meteorology and Astronomy Course Description This is the suggested course sequence that allows one core area of science to be studied per semester. You can change the sequence of the semesters per the needs or interests of your student; materials for each semester are independent of one another to allow flexibility. Semester 1: Meteorology The Earth was created to be the dwelling place of man. It is a complex world and its weather patterns affect our lives every day. Whether you live near the equator, a polar region, or somewhere in between, knowledge of the weather is important. The Weather Book will teach

you: why our exact distance from the sun allows life on earth, how the weather on the other side of the earth affects you, how clouds form and how to identify the different types, what the difference is between a cold and warm front, why you can often see lightning long before you can hear thunder, how to build your own weather station, how to survive in dangerous weather, what the greenhouse effect and the ozone hole are, what Noah's flood and the Ice Age have in common, how weatherpersons forecast hurricanes and tornadoes, how to read a weather map, and what our responsibility is to the environment. Learning about the weather is fun! It will change the way you look at the clouds in the sky. Now you'll have more of an understanding about what is going on miles above your head. And when you hear a weather report on television, you will understand so much more about the world around you!. Semester 2: Astronomy One thing we have in common with the ancients is that all of the human race has gazed at the night sky, and the bright morning, and wondered, "What's out there?" Our universe is so vast and awe-inspiring that to learn about it is to learn about ourselves. The Astronomy Book will teach you: what long-ago astronomers thought about other worlds, solar system facts, how constellations relate to astrology, the history of space exploration, black holes-do they exist?, the origin and age of the moon, why Mars doesn't support life, the composition of stars, supernova remnants, and the myth of star birth, asteroid legends and the extinction of the dinosaurs, are there planets outside our solar system, and could they be home to intelligent life?, what are UFOs?, and the age of comets and meteor showers. Learning about the universe is huge fun! In the

almost infinite expanse above us, we can examine planets, galaxies, and phenomena so beautiful and complex that we never outgrow a childlike wonder. We see our own reflection in the moon, the stars, and in comet trails. The more we learn, the less we fear!

A workbook for an introductory course in Sociology--a broad discipline in terms of both methodology and subject matter. Topics include social stratification (i.e. class relations), religion, secularization, modernity, culture and deviance, and approaches include both qualitative and quantitative research techniques. This is because, as much of what humans do fits under the category of social structure and agency, sociology has gradually expanded its focus to further subjects, such as medical, military and penal organizations, the internet, and even the role of social activity in the development of scientific knowledge. The range of social scientific

methods has also been broadly expanded. The linguistic and cultural turns of the mid-20th century led to increasingly interpretative, hermeneutic, and "postmodern" approaches to the study of society. Conversely, the workbook applies new mathematically rigorous approaches, such as social network analysis.
